COLLECTE LOCALISATION SATELLITES

## IDS 2010 campaign Current status

G. Moreaux, JJ Valette and L. Soudarin  
& all IDS ACs

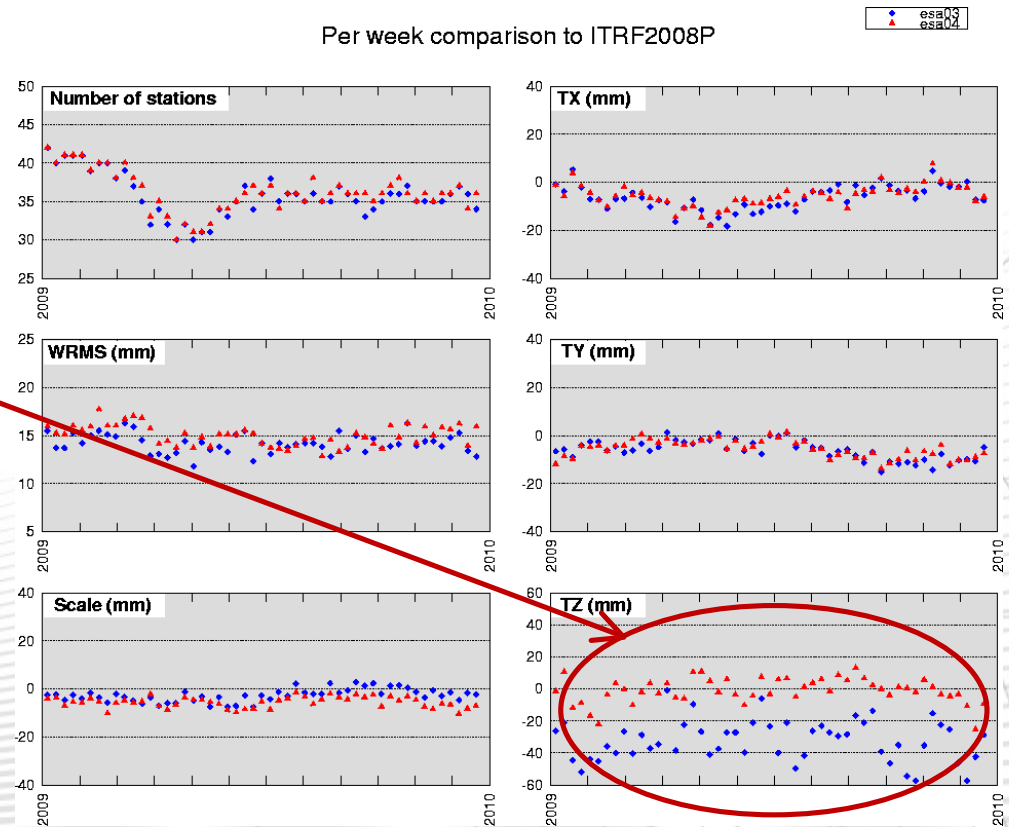

- What is the 2010 campaign ?

Single satellite (Envisat, Jason-2, Spot2, Spot4 and Spot5) solutions over 2009 from IDS Analysis Centers (ESA, GAU, GOP, GSC, IGN and LCA)

- Why such a campaign ?

To investigate on the positive impact of adding Jason-2 in the combined solutions by all the ACs as presented in the last AWG in Darmstadt.

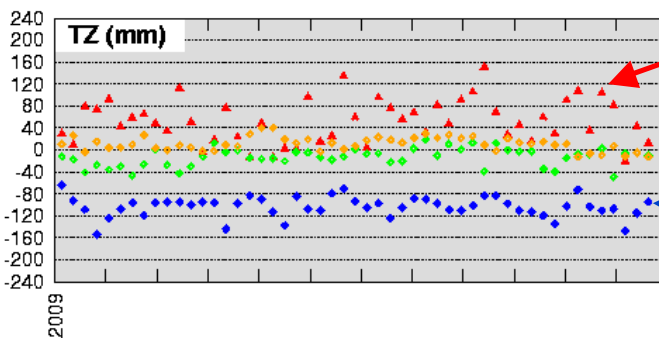

The processing of the SINEX weekly solutions is realized per AC and includes the following steps:

1. Verification of DORIS station identification (domes #, acronym)
2. Rejection of selected stations over the whole time period (never used)
3. Rejection of selected stations over specific periods (partially used)
4. Verification/update of position discontinuities
5. Inversion of free singular normal equations for ESA and GSC
6. Projection using minimal constraints and rejection of perturbing stations
7. Weekly comparisons with ITRF2008P at epoch of each solution
8. Analysis and rejection of stations with high residuals

Processing = processing of IDS-3 + thresholds of step 8 adapted to single satellites

<b>SPOT5</b>	ESA	3.72 (02.33)	-13.34 (05.50)	-3.47 (04.31)	-13.49 (16.44)
	GAU	2.69 (03.06)	-12.28 (04.93)	<b>-13.19</b> (06.74)	3.15 (19.93)
	GOP	<b>16.18</b> (05.25)	<b>-7.20</b> (08.23)	<b>3.02</b> (07.83)	-4.53 (18.87)
	GSC	3.04 (02.36)	-14.39 (05.89)	-8.95 (08.78)	-5.97 (14.57)
	IGN	<b>12.84</b> (04.19)	-12.57 (07.26)	-5.18 (08.94)	1.81 (20.26)
	LCA	8.30 (02.52)	-13.81 (05.28)	1.10 (04.78)	-8.05 (16.49)

- **Number of stations:**
  - Less stations with Jason-2
- **WRMS:**
  - Most of solutions are comparable excepted for Envisat
- **Scale:**
  - 2 groups (Spot4,Spot5/Envisat-Jason-2)
  - Bias for IGN Jason-2 (no correction of phase center – mass center)
- **Tx:**
  - For each AC, all solutions are comparable
  - Clear periodic signal for Jason-2 solutions
  - Jason-2 : Higher variations for GOP and GAU
- **Ty:**
  - Higher values for Jason-2 except for LCA
- **Tz:**
  - Spot5, Jason-2 and combined solutions are centred
  - Envisat and Spot4 solutions are appart from 0
  - Jason-2 is centred and weight of Jason-2 = weight of all other missions  
→ combined solution is centred

# Stations with high residuals

## – Idea :

- Analysis of weekly series of stations with high residuals, i.e. not used for the estimation of the 7 transformation parameters

## – Objectives :

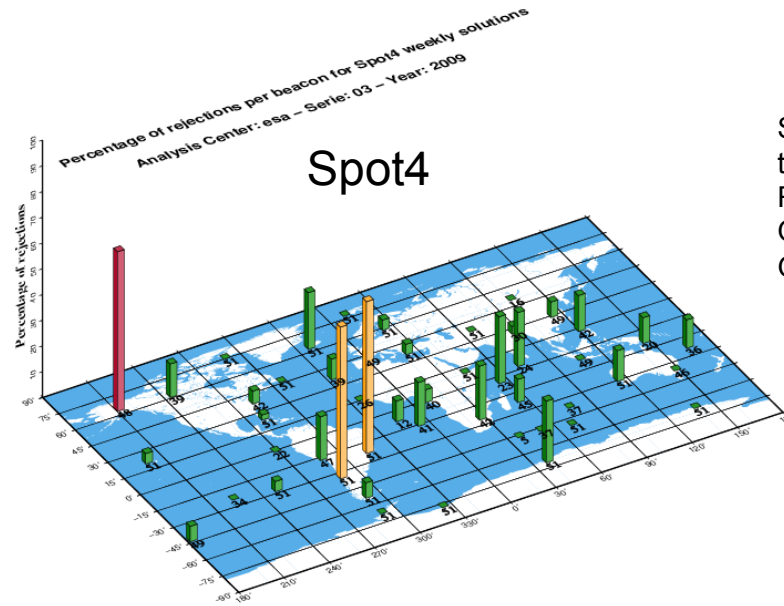

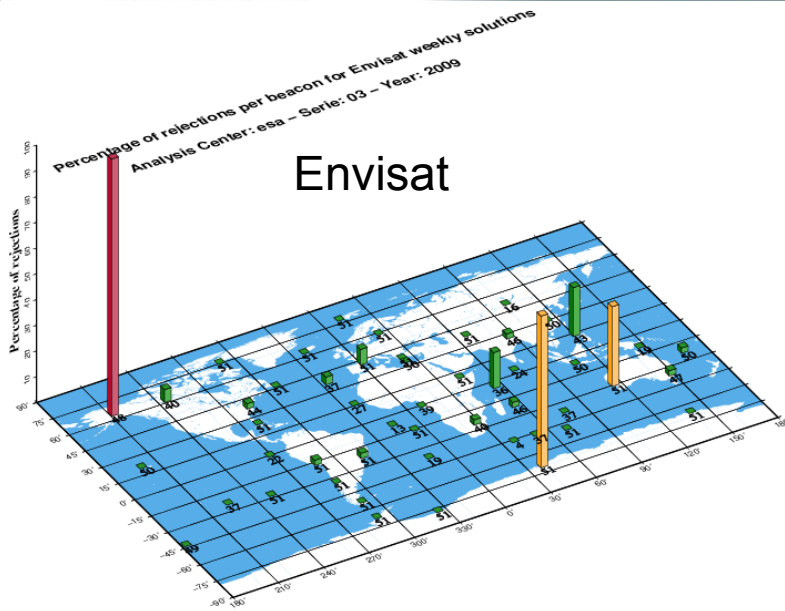

- To see some geographical patterns (SAA ?)
- To isolate some stations with coordinate offsets
- To deduce some sources of improvements

## – Method :

- Geographical plot of the ratio

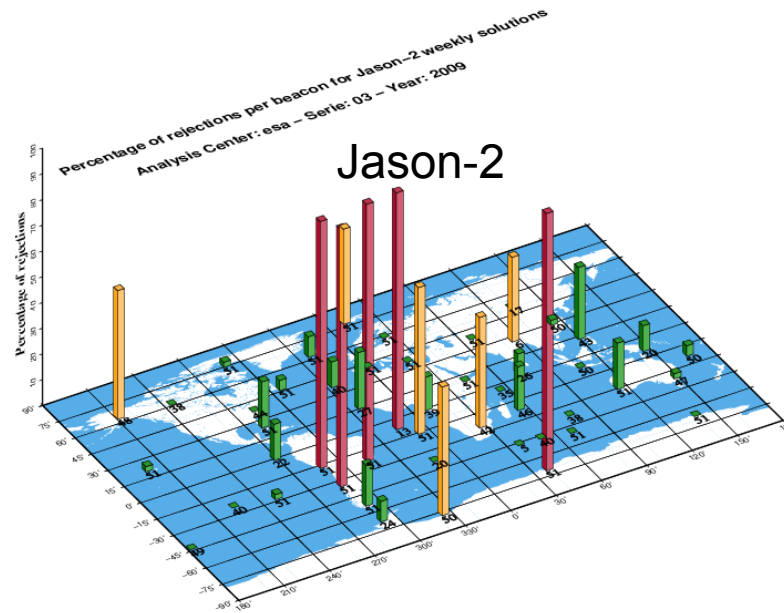

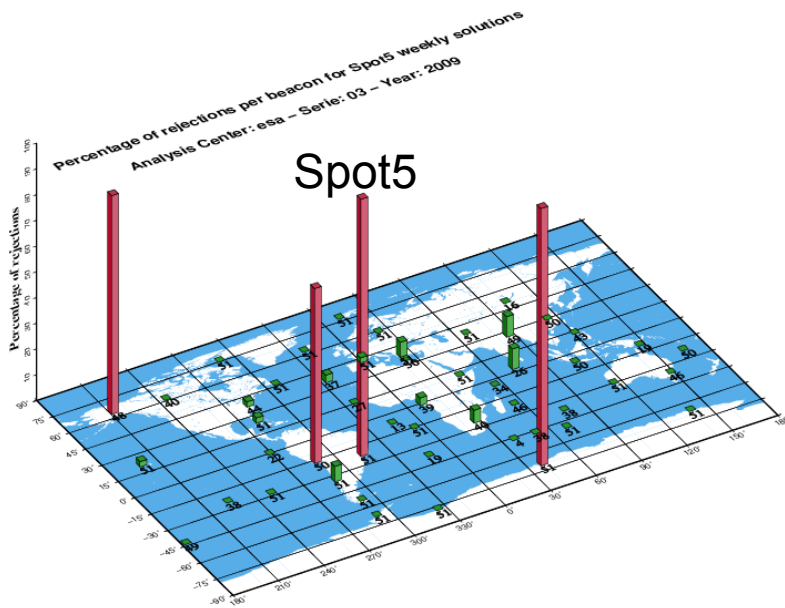

$$\frac{\text{nb of times where the station is not used for the 7P estimation}}{\text{nb of times where the station is in the SINEX weekly files}}$$

# ESA – Stations with high residuals

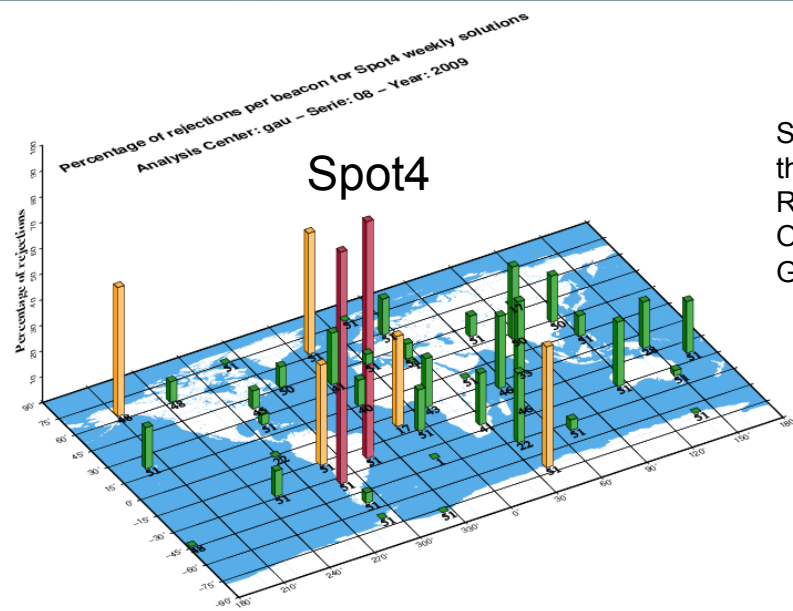

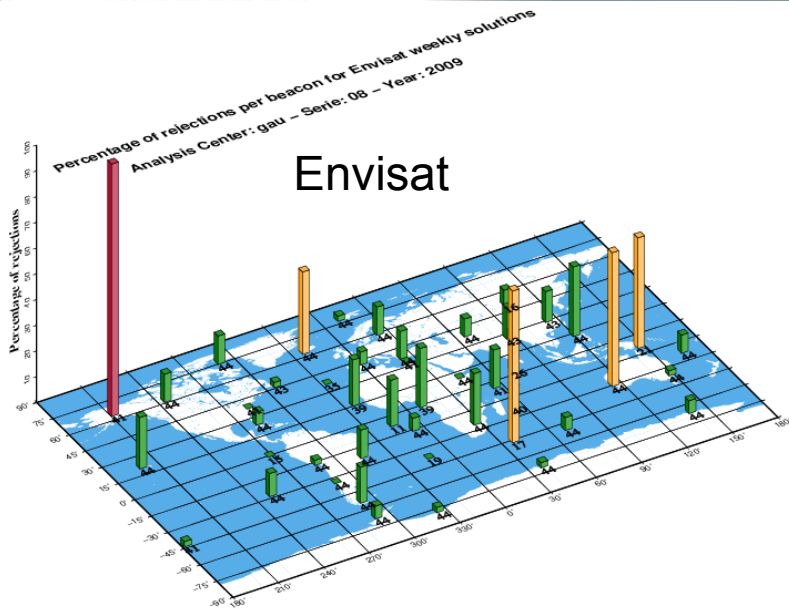

Stations not used for the 7P estimation

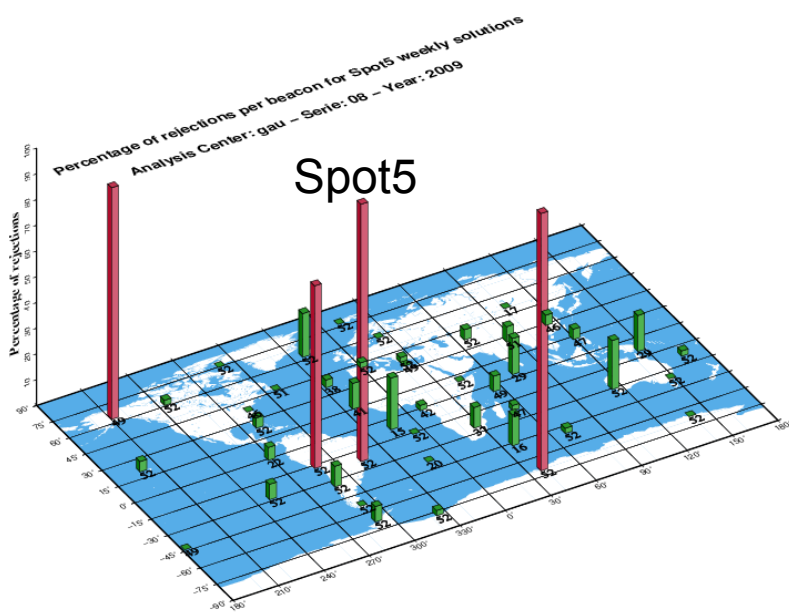

- Red  $60 \leq \% \leq 100$
- Orange  $30 \leq \% < 60$
- Green  $0 \leq \% < 30$

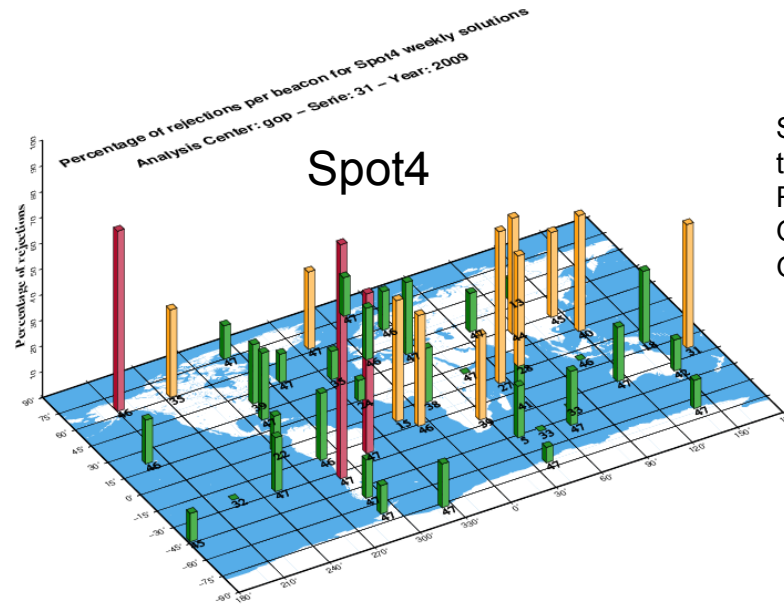

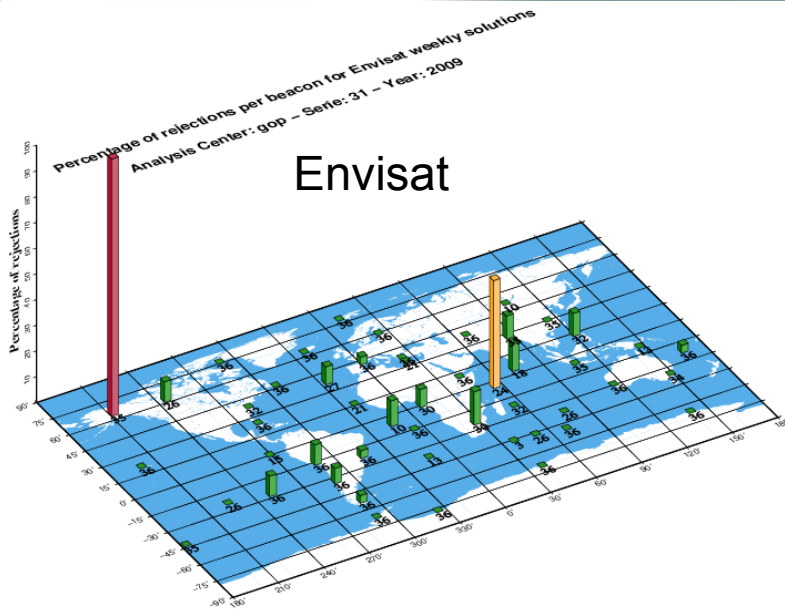

# GAU – Stations with high residuals

Stations not used for the 7P estimation  
 Red  $60 \leq \% \leq 100$   
 Orange  $30 \leq \% < 60$   
 Green  $0 \leq \% < 30$

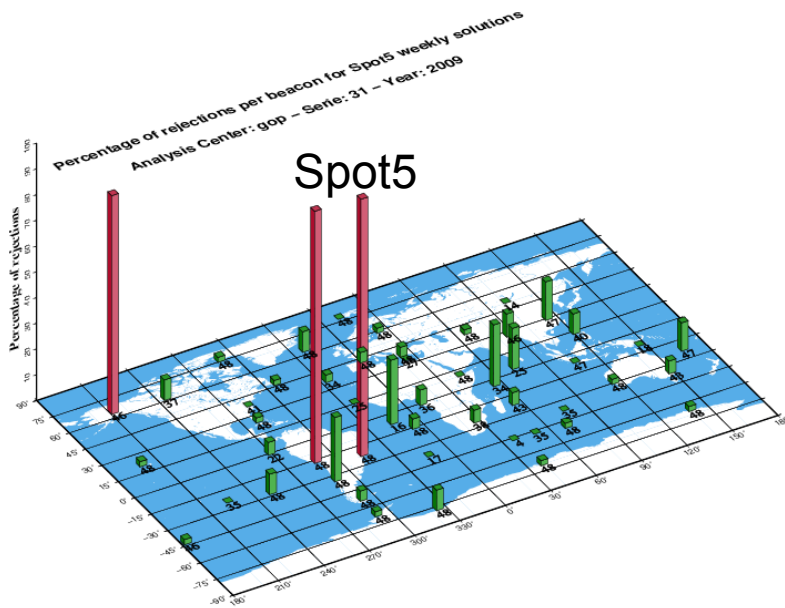

# GOP – Stations with high residuals

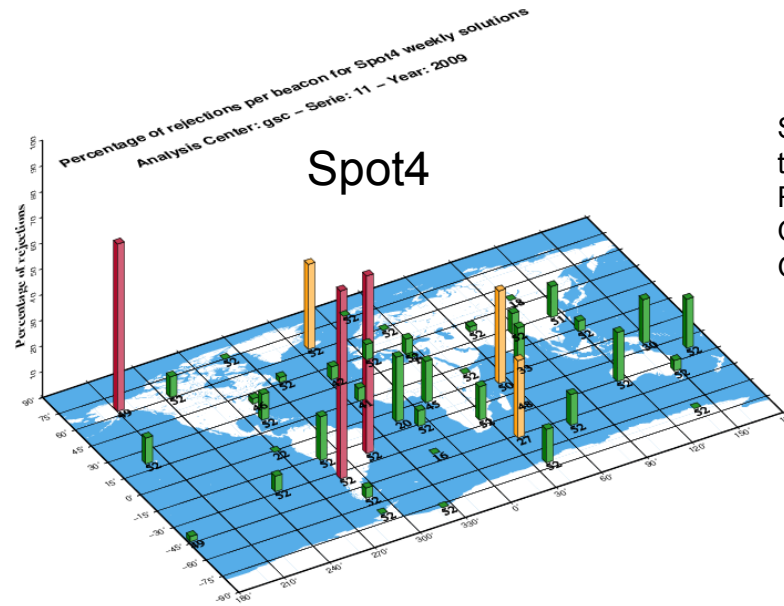

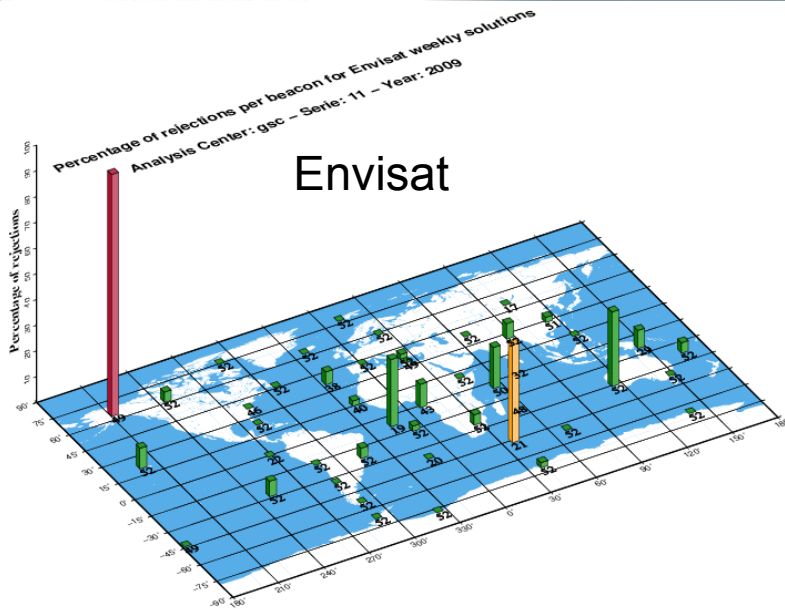

Stations not used for the 7P estimation

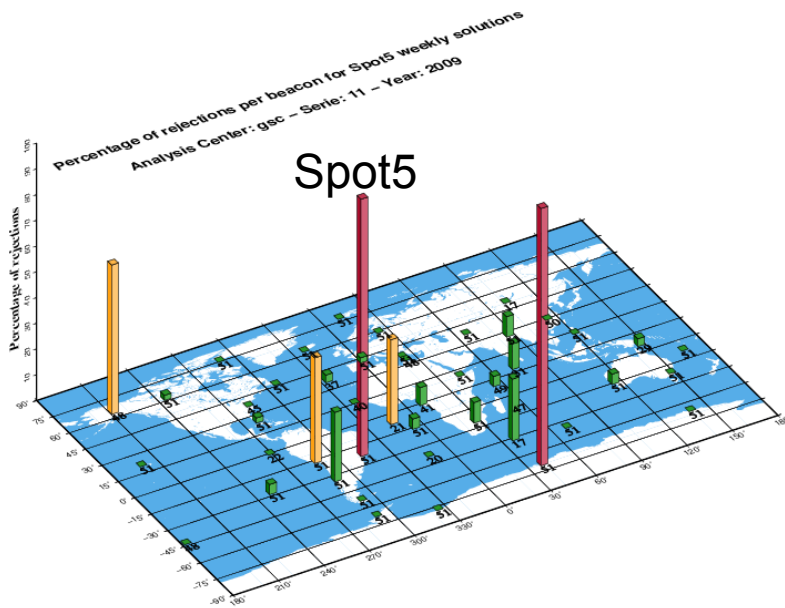

- Red  $60 \leq \% \leq 100$
- Orange  $30 \leq \% < 60$
- Green  $0 \leq \% < 30$

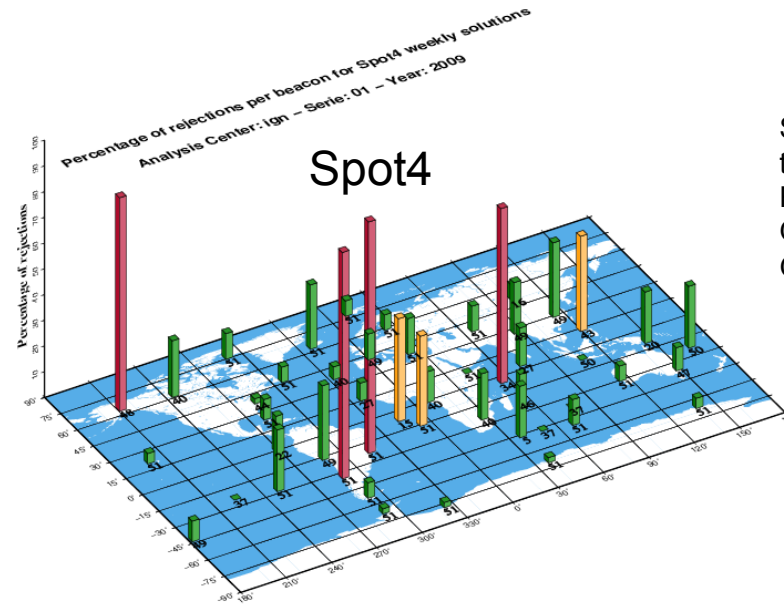

# GSC – Stations with high residuals

Stations not used for the 7P estimation  
 Red  $60 \leq \% \leq 100$   
 Orange  $30 \leq \% < 60$   
 Green  $0 \leq \% < 30$

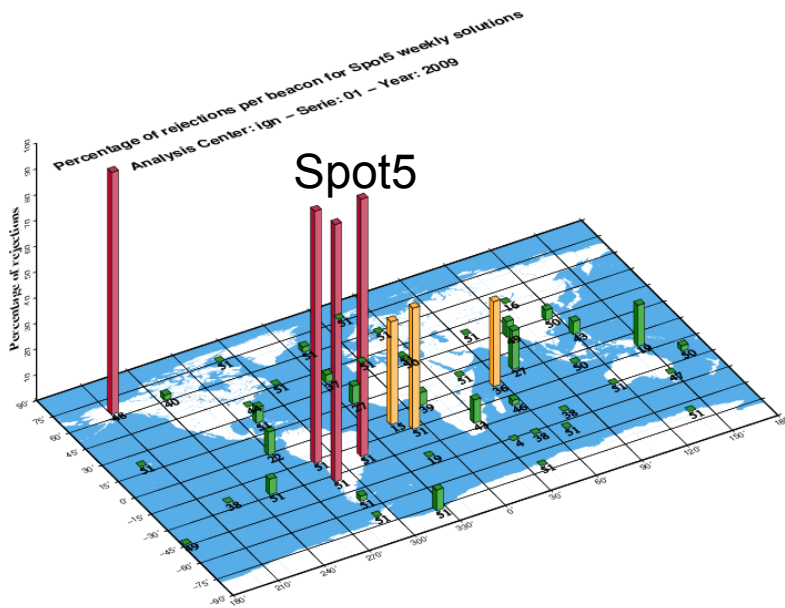

# IGN – Stations with high residuals

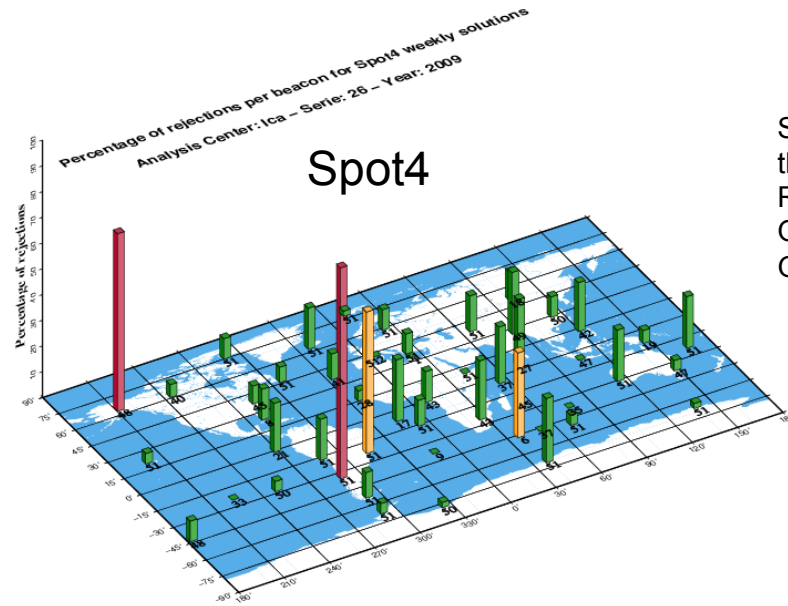

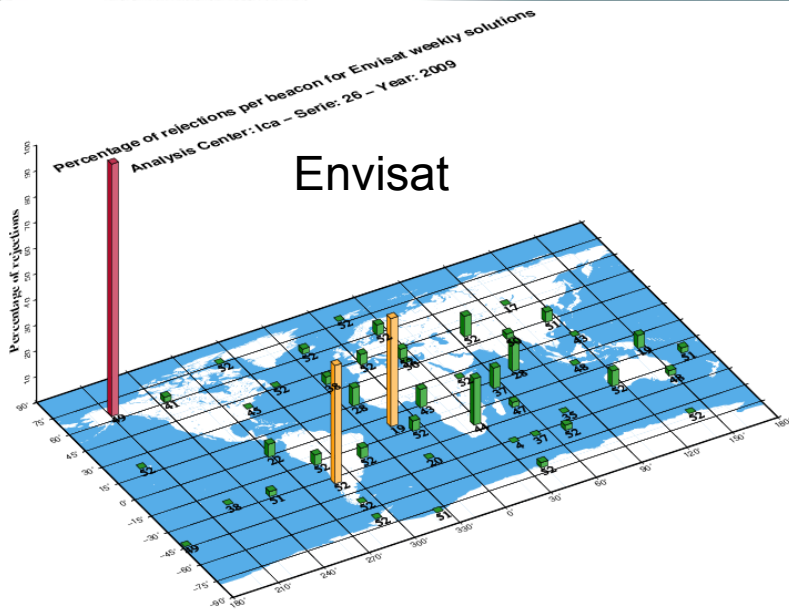

Stations not used for the 7P estimation

- Red  $60 \leq \% \leq 100$
- Orange  $30 \leq \% < 60$
- Green  $0 \leq \% < 30$

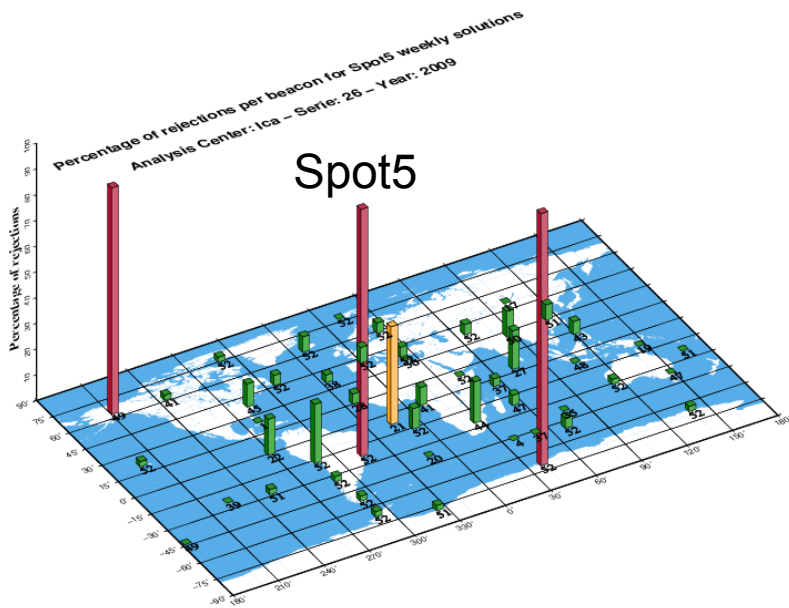

# LCA – Stations with high residuals

Stations not used for the 7P estimation

- Red  $60 \leq \% \leq 100$
- Orange  $30 \leq \% < 60$
- Green  $0 \leq \% < 30$

- **Fairbanks**
  - Origin of systematic high residuals must be investigated
  
- **Arequipa, Cachoiera and Santiago are most of time rejected (excepted for Envisat)**
  - Cut-off angle ?
  - SAA ?
  - Tropospheric correction (mapping function) at low latitude ?
  
- **Syowa ?**
  
- **If we had to sort the satellites with respect with the number of stations with high residuals :**
  1. Envisat
  2. Spot5
  3. Spot4
  4. Jason-2

## – **Conclusions :**

- **Spot4 and Envisat are sources of improvements**
- **Origin of stations with high residuals has to be explored**

## – **What's next ?**

- **Delivery and analysis of Jason-2 2 TUs solutions**
- **EOP analysis**
