## SPOT5: alignment operation of the solar panel

A change of orientation of the SPOT-5's solar array has occured in January 2008.

An angular bias on the orientation of the array on its rotation axis was added in 3 steps:

- On Jan. 15: an angle of $+25^{\circ}$ wrt the origin position wa s applied
- On Jan. 17: an 2nd additional angle of $+10^{\circ}$ was applie d
- On Jan. 22: a 3rd additional angle of $+5^{\circ}$ was applied

Thus, the current angle is $+40^{\circ}$ wrt the origin position ( Sun pointing).

Information about the exact time of the operations is not known. According to the CNES/POD team, most of the alignment operations occured during arc number 213 (16-25/01).
