Vertical motion and mean sea level change

KERG: Vertical land motion and Mean Sea Level (PSMSL)

The Grasse - Corsica multitechnique CAL/VAL complex

• Objectives

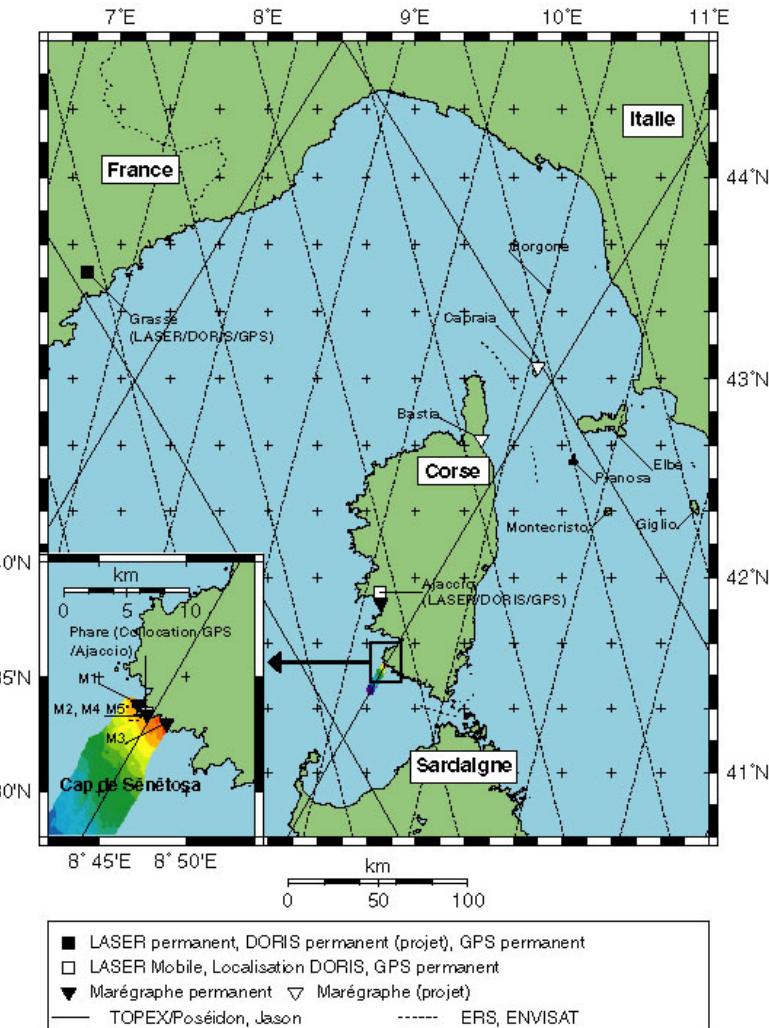

- Long term monitoring of space altimeter calibration:
Topex/Poseidon, Jason 1, ...
- Multi-technique DORIS-GPS-SLR orbital colocation

- Grasse ITRF colocated site
- French transportable laser station (300 kg, 5 mm ranging precision)

- DORIS beacon
- Three sea-bottom tide gauges
- GPS buoys
- GPS-positioned reference point

- source: OCA/CERGA

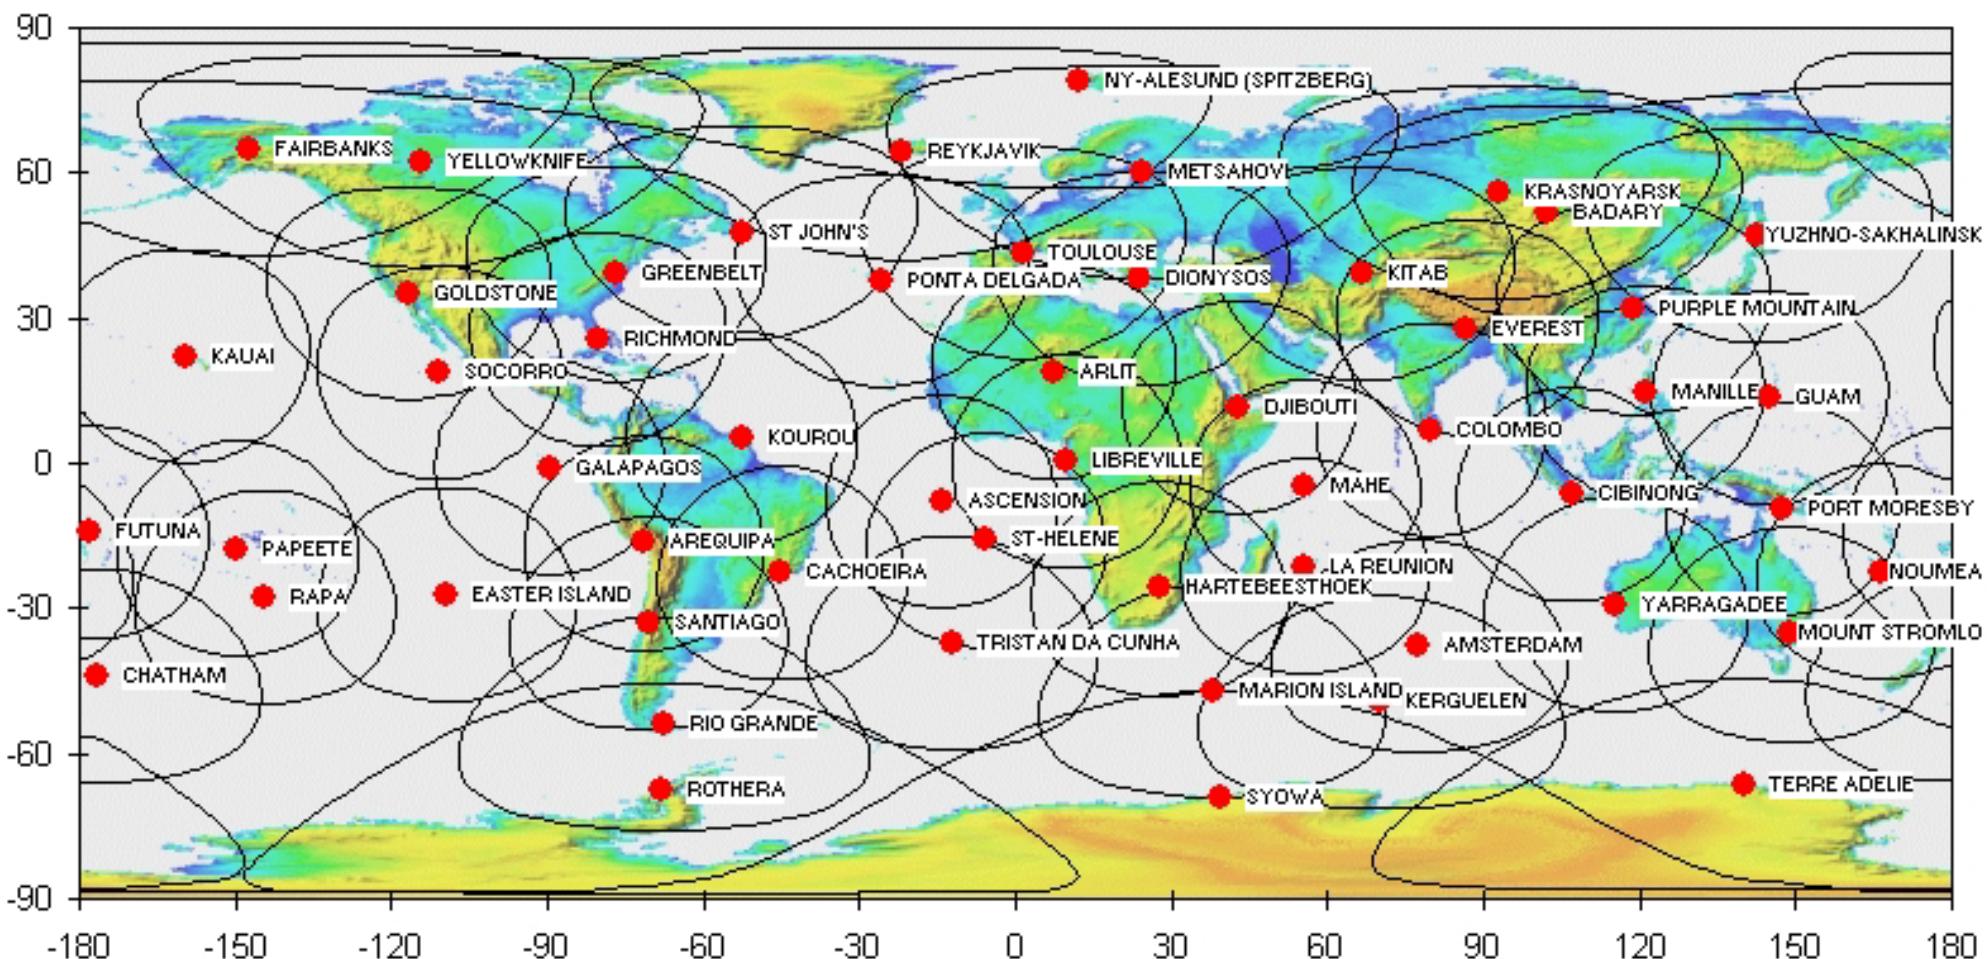

New colocation and altimeter calibration sites

- **VLBI, SLR, GPS (TIGO):**
Concepcion, Chile
- **Altimeter calibration sites:**
 - **Burnie, Tasmania**
 - **Gavdos, Greece**
 - **Grasse-Corsica, France**

DORIS and

- gravimeters
- superconducting gravimeters

Visibility JASON/DORIS
Altitude 1343 km Elevation 15°

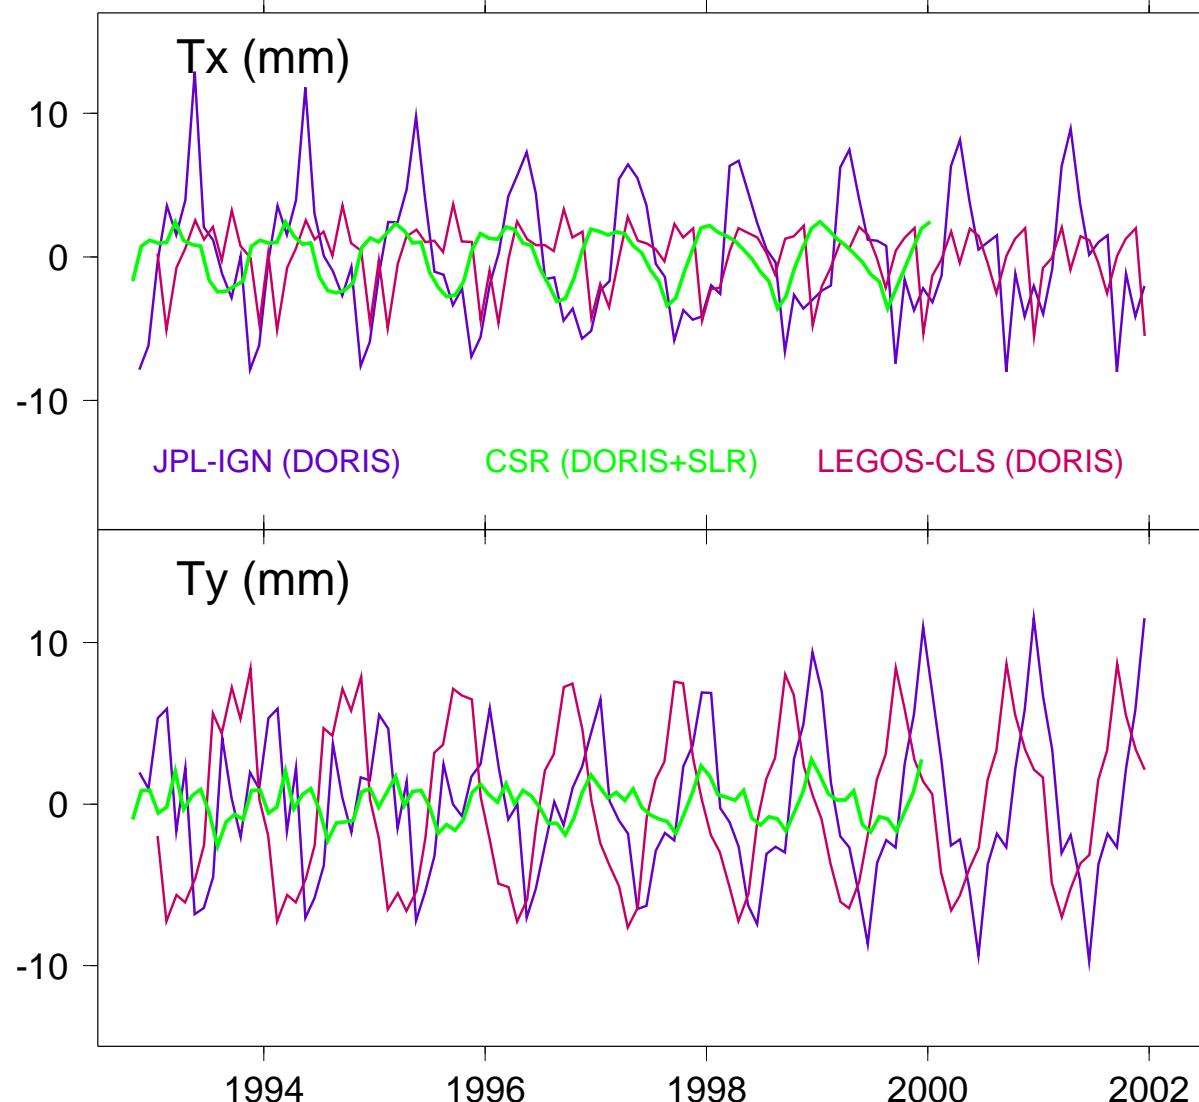

The role of DORIS in gravity field determination

- (missing transparency)

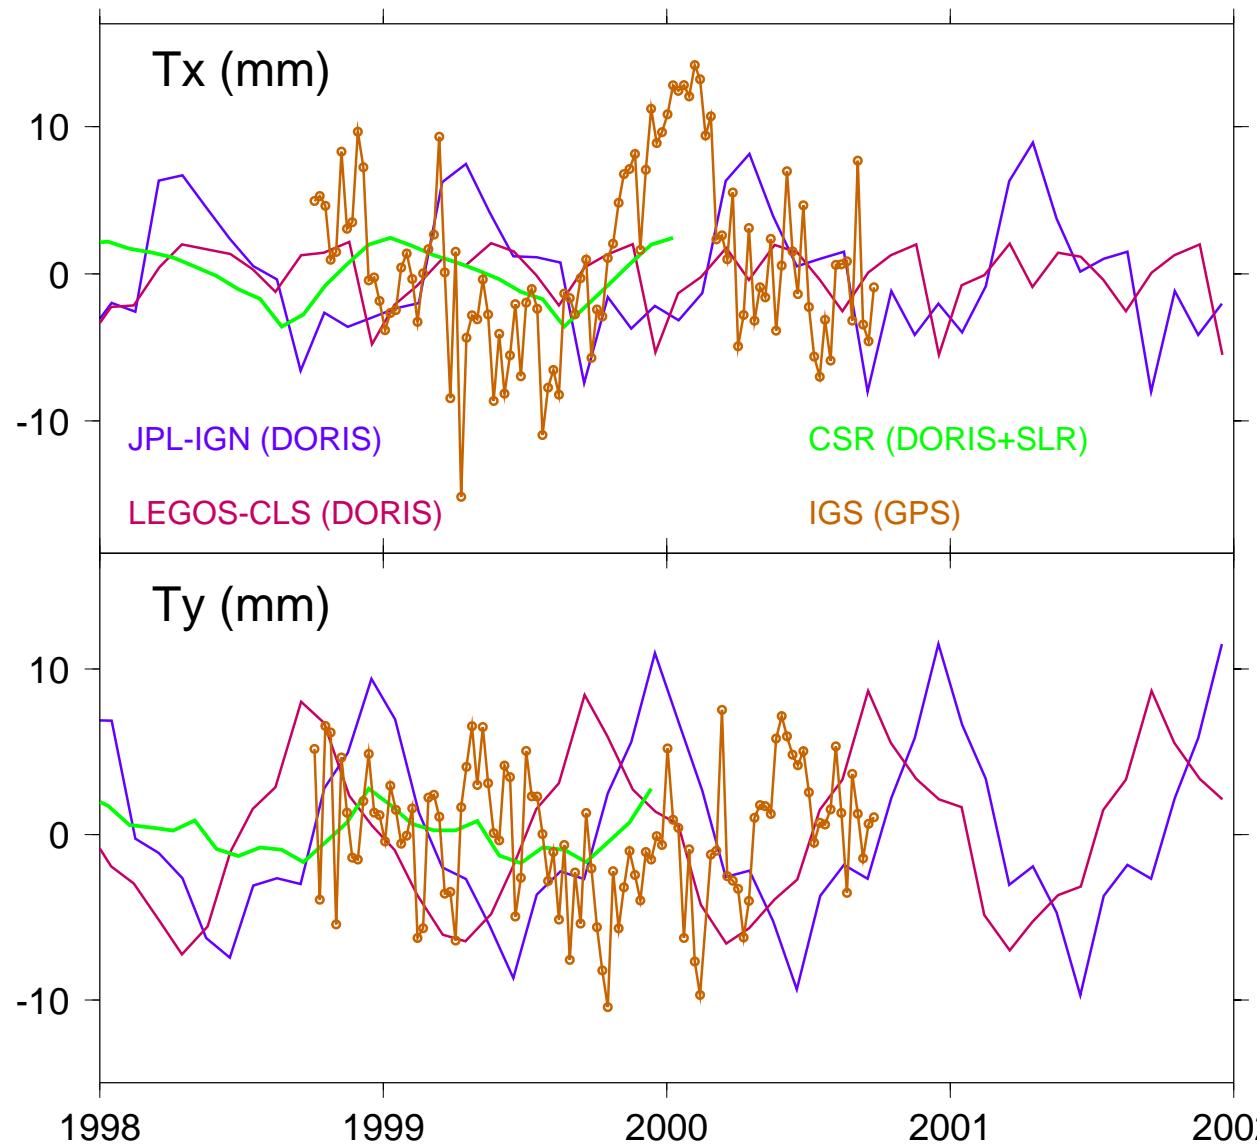

Geocenter: DORIS, SLR

Annual oscillation of equatorial components

Geocenter: DORIS, SLR, GPS

Annual oscillation of equatorial components

Expected improvements of DORIS contributions to global monitoring of the Earth

- **More equiped satellites: Jason 1, Envisat, Spot 5**
- **Better onboard receivers**
- **More and upgraded beacons**

- **More scientific experiments**
- **More analysis centers**
- **Enhanced international coordination**
