# The current status and future plans of GOP AC 

Petr Štěpánek, Vratislav Filler

Research Institute of Geodesy, Topography and Cartography, Zdiby, Czech republic<br>Department of Geodetic Observatory Pecný

## Current status

- Weekly SINEX files delivered until 3Q/2022
- 4Q/2022 processed and SINEX files are ready for delivery
- Sentinel-6 quaternions applied (previous experiments with nominal attitude)
- Hy-2C and Hy-2D macromodels and nominal attitude models implemented
- 4Q/2022 - solutions of various satellite constellation and single satellite solutions - analyzing the effect of Sentinel-6 and Hy-2C,2D
- Alias for SAA stations - Jason-3, Sentinel-6 and Hy-2C

## Coming soon

- Sentinel-6, Hy-2C,2D satellites processing evaluation - longer series
- Some modification in GOP Sinex (elimination of "alias" stations)
- Inspection of the GOP Tx.Ty.Tz series (Ty bias reported by Guilhem)
$>$ Check if the effect is satellite specific or not)
$>$ Understand why I do not observe it in my analysis as significant as Guilhem (different transformation key station selection criterions etc.)
- Single satellite solutions as a standard output together with operational series
- DORIS-only SP3 orbits

## Future prospects

## Sentinel project with TUM Munich (prof. Urs Hugentobler)

- Proposal in preparation
- 2024-2026
- DORIS USO observation by GNSS (continue previous work)
- Stochastic USO model
- DORIS phase processing experiment
- Sentinel-3 tandem phase
- Simulation of DORIS system with all clocks linked to GNSS

## Cooperation with University Bern (Rolf Dach)

- TRF evaluation using DORIS, GNSS, SLR
- Merge DORIS version of Bernese and official version
$>$ after 8 years of independent evolution
$>$ About 1500 files of modified source code

## Single satellite solution scale vs. ITRF2014

- Largest scale for new satellites
- The same effect observed by GRG for $\mathrm{Hy}-2 \mathrm{C}$ and $\mathrm{Hy}-2 \mathrm{D}$

## Observation residuals for stations, $\mathrm{Hy}-2 \mathrm{C}$ and $\mathrm{Hy}-2 \mathrm{D}$

- Strong SAA effect for Hy -2C (as also reported by Hugues Capdeville/GRG AC at IDS Workshop 2022 )

## POD, comparison with CNES/SSALTO multi-technique orbits

- Along track offset for Sentinel-6

| Sat | Mean <br> radial (cm) | Mean <br> along (cm) | Mean <br> cross (cm) | RMS r <br> adial (cm) | RMS <br> along (cm) | RMS <br> cross (cm) |
| :--- | :---: | :--- | :--- | :---: | :---: | :---: |
| Sentinel-6 | -0.1 | -2.9 | 0.0 | 0.9 | 2.8 | 4.0 |
| Hy-2C | 0.0 | -0.1 | 0.2 | 1.0 | 3.0 | 4.2 |
| Hy-2D | 0.0 | -0.2 | 0.1 | 1.0 | 2.8 | 2.7 |

## Estimated SRP coefficient

- Higher for Hy -2C/2D. Attitude mismodeling?

| Sat | SRP |
| :--- | :--- |
| Sentinel-6 | 0.999 |
| Hy-2C | 1.061 |
| Hy-2D | 1.049 |

## Transformation parameters vs. DPOD2014

- About 2.7 mm increment of the scale when including Sentinel-6 and Hy-2C/2D
- Reduction of Tz variations
- Increment of Tx variations (but too short series to analyze annual and semiannual effects)

| Sat combination | TX (mm) | Ty (mm) | Tz (mm) | Scale (mm) |
| :--- | :---: | :--- | :--- | :---: |
| Cryosat-2,Saral, Sentinel -3A,3B, <br> Jason-3 (=5 sats) | $4.6 \pm 2.0$ | $-3.5 \pm 3.9$ | $7.0 \pm 14.1$ | $5.9 \pm 1.4$ |
| 5sats + Sentinel-6 | $2.1 \pm 2.6$ | $-1.8 \pm 3.8$ | $5.1 \pm 11.2$ | $7.1 \pm 1.7$ |
| 5sats + Hy-2D | $3.5 \pm 2.6$ | $-2.4 \pm 4.3$ | $8.5 \pm 8.4$ | $7.1 \pm 1.4$ |
| 5sats + Sentinel-6 + Hy-2D | $2.3 \pm 2.1$ | $-2.8 \pm 4.3$ | $9.2 \pm 9.1$ | $8.2 \pm 1.4$ |
| 5sats + Sentinel-6 + Hy-2D, 2C | $0.9 \pm 2.5$ | $-1.5 \pm 4.1$ | $7.7 \pm 8.4$ | $8.6 \pm 1.5$ |

## Pole vs. IERS CO4 model

- Slight improvement including Sentinel-6 and Hy-2C/2D

| Sat combination | Xp <br> Mean(mas) | Yp <br> Mean(mas) | Xp <br> RMS(mas) | Yp <br> RMS(mas) |
| :--- | :---: | :--- | :---: | :---: |
| Cryosat-2,Saral, Sentinel -3A,3B, <br> Jason-3 (= 5 sats) | 0.19 | -0.08 | 0.38 | 0.38 |
| 5sats + Sentinel-6 | 0.15 | -0.02 | 0.38 | 0.38 |
| 5sats + Hy-2D | 0.21 | -0.10 | 0.39 | 0.39 |
| 5sats + Sentinel-6 + Hy-2D | 0.16 | -0.05 | 0.34 | 0.38 |
| 5sats + Sentinel-6 + Hy-2D, 2C | 0.14 | 0.00 | 0.34 | 0.36 |

## Station weekly repeatability WRMS

- Improvement when including $\mathrm{Hy}-2 \mathrm{C} / 2 \mathrm{D}$ and Sentinel-6A

| Sat combination | Lat (mm) | Lon (mm) | H (mm) |
| :--- | :--- | :--- | :--- |
| Cryosat-2,Saral, Sentinel -3A,3B, <br> Jason-3 (= 5 sats) | 6.55 | 8.98 | 7.65 |
| 5sats + Sentinel-6 | 6.55 | 8.97 | 7.49 |
| 5sats + Hy-2D | 6.29 | 8.40 | 7.24 |
| 5sats + Sentinel-6 + Hy-2D | 6.22 | 8.04 | 7.00 |
| 5sats + Sentinel-6 + Hy-2D, 2C | 6.25 | 7.86 | 6.90 |

Thanks for your attention!
